Parameterised measurement analysis

Reference measurements

Descriptive analysis of supplied measurements. The bundled example is synthetic; no biological inference is intended.

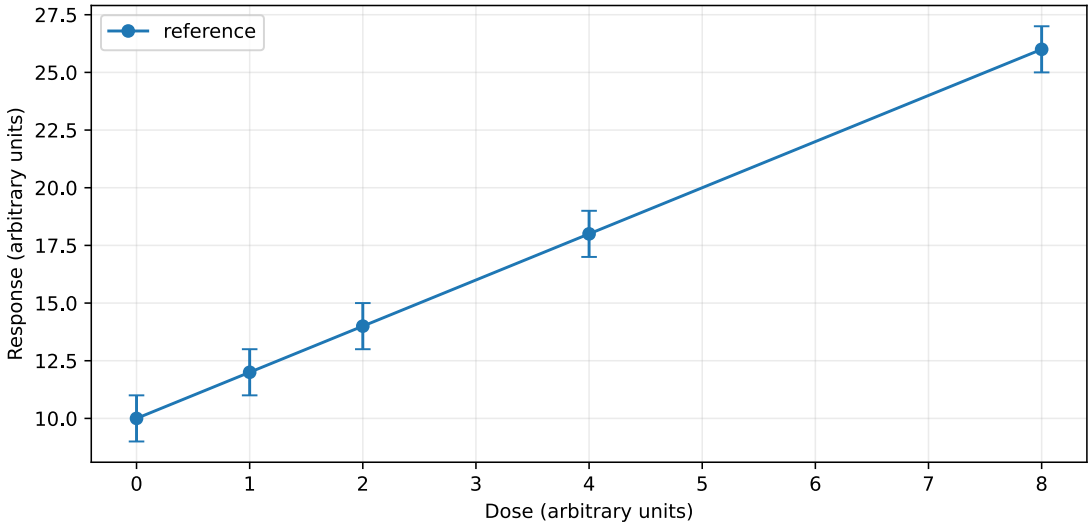
Selection and provenance

- Group: reference
- Minimum dose (inclusive): 0
- Input observations: 30
- Selected observations: 15
- Input
  SHA-256: `9872ae0c57e0d8a5e531918fc22cc6ef762e384cd259e59c748121739135a243`

Summary by group and dose

Group	Dose	Count	Mean response	Sample SD
reference	0	3	10.000000	1.000000
reference	1	3	12.000000	1.000000
reference	2	3	14.000000	1.000000
reference	4	3	18.000000	1.000000
reference	8	3	26.000000	1.000000

Measurement profile



Method and limitations

Each group and dose is summarised independently using the arithmetic mean and sample standard deviation. Error bars show sample standard deviation, not confidence intervals. Singleton doses have undefined standard deviation (NA) and no error bar. Connecting lines are visual guides. There is no curve fitting, hypothesis test, potency estimate, or claim about experimental efficacy. Dose and response units must be established by the data provider; this template uses arbitrary units. Summary display values are rounded; the accompanying JSON preserves numerical precision. The input fingerprint identifies the original CSV bytes.
